Abstract: We compute the one-loop amplitude for a Higgs boson, a quark-antiquark pair and a pair of gluons of negative helicity, i.e. for the next-to-maximally helicity violating (NMHV) case, $\mathcal{A}(H, 1^+, 2^-, 3^-, 4^-)$. The calculation is performed using an effective Lagrangian which is valid in the limit of very large top quark mass. As a result of this paper all amplitudes for the transition of a Higgs boson into 4 partons are now known analytically at one-loop order.

Keywords: QCD, Higgs boson, Hadron colliders, Tevatron, LHC.
1. Introduction

The hunt for the standard model Higgs boson is about to enter the endgame phase. The lower and upper limits coming from direct searches at LEP [1] and indirect constraints from precision electroweak data from the Tevatron and LEP [2] are now supplemented by the first direct limit from a hadron collider [3, 4]. With the increase of luminosity at the
Tevatron and the advent of running at the LHC, a discovery or a more stringent set of limits is to be expected.

An important search channel for the Higgs boson, in the mass range \(115 < m_H < 160\) GeV, is production via weak boson fusion [5]. A Higgs boson produced in this channel is expected to be produced relatively centrally, in association with two hard forward jets. These striking kinematic features are expected to enable a search for such events despite the otherwise overwhelming QCD backgrounds. Confidence in the theoretical prediction for the Higgs signal process is based upon knowledge of next-to-leading order corrections in both QCD [6–8] and in the electroweak sector [9, 10].

However, in addition to the weak process, a significant number of such events may also be produced via the strong interaction. In order to accurately predict the signal and, in particular, to simulate faithfully the expected significance in a given Higgs model, a fully differential NLO calculation of QCD production of a Higgs and two hard jets is also required.

In the Standard Model the Higgs couples to two gluons via a top-quark loop. Calculations which involve the full dependence on \(m_t\) are difficult and a drastic simplification can be achieved if one works in an effective theory in which the mass of the top quark is large [11–13]. For inclusive Higgs production this approximation is valid over a wide range of Higgs masses and, for processes with additional jets, the approximation is justified provided that the transverse momentum of each jet is smaller than \(m_t\) [14]. Tree-level calculations have been performed in both the large-\(m_t\) limit [15, 16] and with the exact-\(m_t\) dependence.

Results for the one-loop corrections to all of the Higgs + 4 parton processes have been published in 2005 [17]. Although analytic results were provided for the Higgs \(\bar{q}q\bar{q}q\) processes, the bulk of this calculation was performed using a semi-numerical method. In this approach the loop integrals were calculated analytically whereas the coefficients with which they appear in the loop amplitudes were computed numerically using a recursive method. Although some phenomenology was performed using this calculation [18], the implementation of fully analytic formulae will lead to a faster code and permit more extensive phenomenological investigations.

In recent years enormous progress has been made in solving the problem of evaluating virtual corrections to NLO scattering processes. Building upon the remarkable work of Bern, Dixon, Dunbar and Kosower during the mid-nineties [19, 20], unitarity constructions for these virtual corrections have developed into an efficient algebraic technique. The modern generalised unitarity method utilises quadruple cuts with complex momenta to freeze four dimensional loop momenta and uniquely determine the box coefficients [22]. The computation of triangle and bubble coefficients is also reduced to an algebraic procedure by application of an OPP style integrand reduction [23–25] or using direct analytic extraction [26]. Further developments employing D-dimensional cutting techniques [27–30] extend the method to compute full one-loop amplitudes. The procedure is well suited to numerical implementations and a number of automated approaches have been developed to the point of phenomenological applications [31–39].

In this paper we derive a compact analytic formula for the Higgs NMHV amplitude.
with a quark-antiquark pair and two like-helicity gluons. This is achieved by splitting the real Higgs scalar into two complex scalars ($\phi$ and $\phi^\dagger$) such that the Higgs amplitude is recovered in the sum [40]. Coefficients of box, triangle and bubble integrals are computed by applying the generalised unitarity method in four-dimensions. The rational terms are extracted from a Feynman diagram computation which is simplified using the knowledge of unphysical singularities in the cut-constructible terms.

The paper is organised as follows. In Section 2 we describe the large top-mass approximation and the decomposition of the Higgs into self-dual ($\phi$) and anti-self-dual ($\phi^\dagger$) components. Section 3 recalls the colour decomposition into primitive amplitudes and section 4 provides a guide to the current literature on Higgs + 4 parton amplitudes and recalls the known analytic results for $\phi \bar{q} q g g$ amplitudes that are needed to construct results for the Higgs boson. In section 5 we present analytic results that are sufficient for a complete description of the NMHV amplitude. We numerically evaluate the obtained expressions for the one-loop colour ordered amplitudes in section 6 before drawing our conclusions.

2. Effective Lagrangian

Our calculation is performed using an effective Lagrangian to express the coupling of gluons to the Higgs field [11],

$$L^\text{int}_H = \frac{C}{2} H \, \text{tr} \, G_{\mu\nu} \, G^{\mu\nu} \quad (2.1)$$

This Lagrangian is obtained by replacing the full one-loop coupling of the Higgs boson to the gluons via an intermediate top quark loop, by an effective local operator. The effective Lagrangian approximation is valid in the limit $m_H < 2m_t$. At the order required in this paper, the coefficient $C$ is given by [12, 13],

$$C = \frac{\alpha_S}{6\pi v} \left( 1 + \frac{11}{4\pi} \alpha_S \right) + \mathcal{O}(\alpha_S^3) \quad (2.2)$$

Here $v$ is the vacuum expectation value of the Higgs field, $v = 246$ GeV. The trace in Eq. (2.1) is over the colour degrees of freedom which, since SU(3) generators in the fundamental representation are normalised such that $\text{tr} T^a T^b = \delta^{ab}$, implies that $\text{tr} G_{\mu\nu} G^{\mu\nu} = G^a_{\mu\nu} G^{a\mu\nu}$.

Following reference [40] we will introduce a complex scalar field,

$$\phi = \frac{1}{2} (H + iA) , \quad \phi^\dagger = \frac{1}{2} (H - iA) \quad (2.3)$$

so that the effective Lagrangian, Eq. (2.1), can be written as,

$$L^\text{int}_{H,A} = \frac{C}{2} \left[ H \, \text{tr} \, G_{\mu\nu} \, G^{\mu\nu} + iA \, \text{tr} \, G_{\mu\nu} \, *G^{\mu\nu} \right]$$

$$= C \left[ \phi \, \text{tr} \, G^a_{SD \, \mu\nu} \, G^a_{SD} + \phi^\dagger \, \text{tr} \, G^a_{ASD \, \mu\nu} \, G^a_{ASD} \right] , \quad (2.4)$$

where the gluon field strength has been separated into a self-dual and an anti-self-dual component,

$$G^{\mu\nu}_{SD} = \frac{1}{2} (G^{\mu\nu} + *G^{\mu\nu}) , \quad G^{\mu\nu}_{ASD} = \frac{1}{2} (G^{\mu\nu} - *G^{\mu\nu}) , \quad *G^{\mu\nu} \equiv i \epsilon^{\mu\nu\rho\sigma} G_{\rho\sigma} . \quad (2.5)$$
Calculations performed in terms of the field $\phi$ are simpler than the calculations for the Higgs boson and, moreover, the amplitudes for $\phi^\dagger$ can be obtained by parity. In the final stage, the full Higgs boson amplitudes are then written as a combination of $\phi$ and $\phi^\dagger$ components:

$$A(H, \{p_k\}) = A(\phi, \{p_k\}) + A(\phi^\dagger, \{p_k\}),$$
$$A(A, \{p_k\}) = -i \left( A(\phi, \{p_k\}) - A(\phi^\dagger, \{p_k\}) \right).$$

(2.6)

3. Definition of colour ordered amplitudes

The colour decomposition of the $H\bar{q}qgg$ amplitudes is exactly the same as for the case $\bar{q}qgg$ which was written down in ref. [21]. For the tree graph there are two colour stripped amplitudes,

$$A_4^{(0)}(\phi, 1\bar{q}, 2q, 3g, 4g) = Cg^2 \sum_{\sigma \in S_2} (T^{a\sigma(3)}T^{a\sigma(4)})_{i_1i_2} A_4^{(0)}(\phi, 1\bar{q}, 2q, \sigma(3), \sigma(4)).$$  (3.1)

At one-loop level the colour decomposition is,

$$A_4^{(1)}(\phi, 1\bar{q}, 2q, 3g, 4g) = Cg^4 c_T \left[ N_c \sum_{\sigma \in S_2} (T^{a\sigma(3)}T^{a\sigma(4)})_{i_1i_2} A_{4;1}(\phi, 1\bar{q}, 2q, \sigma(3), \sigma(4)) + \delta^{a_3a_4} \delta^{i_1i_2} A_{4;3}(\phi, 1\bar{q}, 2q, 3g, 4g) \right].$$  (3.2)

In these equations $g$ is the strong coupling constant and $c_T$ is the ubiquitous one-loop factor,

$$c_T \equiv \frac{1}{(4\pi)^2-\epsilon} \frac{\Gamma(1+\epsilon)\Gamma^2(1-\epsilon)}{\Gamma(1-2\epsilon)}.$$  (3.3)

The colour stripped amplitudes $A_{4;1}$ and $A_{4;3}$ can further be decomposed into primitive amplitudes,

$$A_{4;1}(\phi, 1\bar{q}, 2q, 3g, 4g) = A_4^L(\phi, 1\bar{q}, 2q, 3g, 4g) - \frac{1}{N_c^2} A_4^R(\phi, 1\bar{q}, 2q, 3g, 4g) + \frac{n_f}{N_c} A_4^L(\phi, 1\bar{q}, 2q, 3g, 4g),$$  (3.4)

and,

$$A_{4;3}(\phi, 1\bar{q}, 2q, 3g, 4g) = A_4^L(\phi, 1\bar{q}, 2q, 3g, 4g) + A_4^R(\phi, 1\bar{q}, 2q, 3g, 4g) + A_4^L(\phi, 1\bar{q}, 3g, 2q, 4g) + A_4^L(\phi, 1\bar{q}, 2q, 4g, 3g) + A_4^L(\phi, 1\bar{q}, 4g, 2q, 3g).$$  (3.5)

All of these colour decomposition equations, namely Eqs. (3.1), (3.2), (3.4), (3.5) are equally valid if the $\phi$ is replaced by a $\phi^\dagger$ or a Higgs boson $H$. Sample diagrams contributing to each of the primitive amplitudes are shown in Figure [II].
4. Known analytic results for Higgs + 4 parton amplitudes

In this section we review results from the literature and collect formulae, for both tree and one-loop results, that will be useful in constructing the Higgs NMHV amplitude.

4.1 Tree graph results

The results for the tree graphs that are primarily of interest here, i.e. $\phi \bar{q}qqg$ amplitudes with gluons of the same helicity, are:

$$-iA_4^{(0)}(\phi, 1_{\bar{q}}, 2^+, 3^-, 4^-) = -\frac{3(1 + 4)|2|^2}{24} \langle 41 \rangle \left[ \frac{1}{s_{12}} + \frac{1}{s_{41}} \right]$$

$$- \frac{\langle 4(1 + 3)|2|^2}{23} \langle 13 \rangle + \frac{(1)(3 + 4)|2|^2}{(12)|24|}[23][34],$$ (4.1)

$$-iA_4^{(0)}(\phi, 1_{\bar{q}}, 2^+, 3^+, 4^-) = 0,$$ (4.2)

and for the subleading colour piece,

$$-iA_4^{(0)}(\phi, 1_{\bar{q}}, 2^-, 3^+, 4^+) = -\frac{3(1 + 3)|3|^2}{12} \langle 23 \rangle \frac{2(1 + 4)|3|^2}{34} \langle 41 \rangle \frac{1}{s_{123}} - \frac{2}{[12][23][34][41] s_{341}},$$ (4.3)

$$-iA_4^{(0)}(\phi, 1_{\bar{q}}, 2^+, 3^-, 4^+) = 0.$$ (4.4)

A brief summary of our spinor notation is given in Appendix A. Compact analytic expressions for all helicity amplitudes are presented in references [45, 46].
By using parity and charge conjugation [47], we can relate these $\phi q\bar{q}gg$ amplitudes to ones for $\phi^4qqgg$ with the same helicity assignments of quark and antiquark. This relation, valid at any order of perturbation theory, $n$, reads,

$$A^{(n)}_4(\phi^+, i_{\bar{q}}^{-h_q}, \phi_{-h_q}, g_{h^3}, 4_{-h_4}) = -A^{(n)}_4(\phi, 2_{-h_q}, 1_{\bar{q}}^{h_q}, 4_{-h_4}, 3_{-h_3}) \bigg|_{(i,j)\to[i,j]}.$$  \hspace{1cm} (4.5)

We thus see that the $\phi^4$ amplitude in which we are interested is zero,

$$-i A^{(0)}_4(\phi^+, 1_{\bar{q}}^{-}, 2_{+}, 3_{-}, 4_{-}) = 0,$$

so that, at tree graph level, the NMHV Higgs amplitude in which we will ultimately be interested is simply given by Eq. (4.4).

### 4.2 One-loop results

We begin this section with a brief survey of the literature, to indicate where original calculations of $Hq\bar{q}q$ and $Hqqgg$ amplitudes may be found. We then turn to the $Hq\bar{q}q$ amplitudes, concluding the section by quoting the results for the $\phi^4$ amplitude that must be combined with the new $\phi$ amplitude calculation that we present here.

#### 4.2.1 $Hq\bar{q}q$ amplitudes

The full one-loop results for this process, both for pairs of identical and non-identical quarks, are already available in the literature. The matrix element squared has been computed in ref. [17], with results for the amplitude presented in ref. [46].

#### 4.2.2 $Hqqgg$ amplitudes

In principle there are 16 combinations of amplitudes, but this number is reduced to four independent amplitudes by parity and cyclicity. The references to the complete set of needed amplitudes are given in Table I. In addition a nice summary of all the one-loop results for the Higgs + 4 gluon amplitudes is given in ref. [45].

\hline
\end{tabular}
\caption{\(\phi\) and \(\phi^I\) amplitudes needed to construct a given one-loop \(Hqgqq\) amplitude, together with the references where they can be obtained. In all cases the \(\phi^I\) amplitudes are constructed from the \(\phi\) amplitudes given in the reference, using the parity operation. The cases where the gluons have the same helicity, which have no associated references, are the subject of this paper.}
\end{table}

4.2.3 \textit{Hqgqq} amplitudes

In principle there are 8 combinations of amplitudes, since helicity is conserved on the quark line, but because of parity invariance only four Higgs amplitudes are independent. The references to the amplitudes already calculated in the literature are given in Table 2. From this table we see that the Higgs amplitude \(\mathcal{A}(H, 1_q^{-}, 2_q^{+}, 3_g^{-}, 4_g^+)\) requires, in addition to the calculation of a previously unknown \(\phi\) amplitude, also the results for the corresponding \(\phi^I\) amplitude from ref. [46].

The \(\phi^I\) results that we shall need can be derived from the following amplitudes in the case of \(A_{4;1}\),

\begin{equation}
-iA_4^L(\phi, 1_q^{-}, 2^+_q, 3^+_g, 4^+_g) = 2i A_4^{(0)}(\phi^I, 1_q^{-}, 2^+_q, 3^+_g, 4^+_g)
+ \frac{1}{2} \left[ \frac{(1)(2+3)[4]}{(23) \langle 34 \rangle} + \frac{(12) \langle 23 \rangle \langle 31 \rangle}{(23) \langle 34 \rangle \langle 41 \rangle} \right] - \frac{1}{3} \left( \frac{1}{12} \langle 34 \rangle \langle 41 \rangle \right)^2,
\end{equation}

\begin{equation}
-iA_4^R(\phi, 1_q^{-}, 2^+_q, 3^+_g, 4^+_g) = -\frac{1}{2} \left[ \frac{(1)(2+3)[4]}{(23) \langle 34 \rangle} + \frac{(12) \langle 23 \rangle \langle 31 \rangle}{(23) \langle 34 \rangle \langle 41 \rangle} \right],
\end{equation}

\begin{equation}
-iA_4^L(\phi, 1_q^{-}, 2^+_q, 3^+_g, 4^+_g) = \frac{1}{3} \left( \frac{1}{12} \langle 34 \rangle \langle 41 \rangle \right)^2,
\end{equation}

whilst the subleading partial amplitude \(A_{4;3}\) also requires the results,

\begin{equation}
-iA_4^R(\phi, 1_q^{-}, 2^+_q, 3^+_g, 4^+_g) = -\frac{2}{12} \left( \frac{(1)(2+3)[4]}{(23) \langle 34 \rangle} \right)^2 + \frac{1}{2} \left[ \frac{(1)(3+4)[2]}{(23) \langle 34 \rangle \langle 41 \rangle} + \frac{(13)^2 [34]}{(12) \langle 23 \rangle \langle 34 \rangle} \right],
\end{equation}

\begin{equation}
A_4^R(\phi, 1_q^{-}, 2^+_q, 3^+_g, 4^+_g) = 0.
\end{equation}

To obtain the form that is most useful for the calculation of \(\mathcal{A}(H, 1_q^{-}, 2^+_q, 3_g^{-}, 4_g^+)\), we relate the \(\phi^Iqgqq\) amplitudes to the \(\phi qgqq\) ones by using the relation in Eq. (4.7). Thus we obtain the required results by performing the transformation \(1 \leftrightarrow 2, 3 \leftrightarrow 4, \langle \rangle \leftrightarrow []\) and reversing the sign. The amplitudes contributing to \(A_{4;1}\) are,

\begin{equation}
-iA_4^L(\phi^I, 1_q^{-}, 2^+_q, 3^+_g, 4^+_g) = 2i A_4^{(0)}(\phi^I, 1_q^{-}, 2^+_q, 3^+_g, 4^+_g)
+ \frac{1}{2} \left[ \frac{(3)(1+4)[2]}{[14] \langle 34 \rangle} + \frac{(21) \langle 14 \rangle \langle 24 \rangle}{[14] \langle 34 \rangle \langle 23 \rangle} \right] - \frac{1}{3} \left[ \frac{24}{[12] \langle 34 \rangle} \right]^2.
\end{equation}

\begin{equation}
-iA_4^R(\phi^I, 1_q^{-}, 2^+_q, 3^+_g, 4^+_g) = -\frac{1}{2} \left[ \frac{(3)(1+4)[2]}{[14] \langle 34 \rangle} + \frac{(21) \langle 14 \rangle \langle 24 \rangle}{[14] \langle 34 \rangle \langle 23 \rangle} \right],
\end{equation}
\[ -iA_4^L(\phi^\dagger, 1_q^-, 2_q^+, 3_g^-, 4_g^-) = \frac{1}{3} \frac{[2 4][3 4][2 3]}{[1 2][3 4]^2}, \]

while the additional subleading contributions become,

\[ -iA_4^L(\phi^\dagger, 1_q^-, 3_g^-, 2_q^+, 4_g^-) = 2 \frac{(3|4 + 1)|2|^2}{[2 4][4 1]} s_{124} - \frac{1}{2} \left[ \frac{[2 1][4|1 + 3|2]}{4 1}[3 2] + \frac{[2 4][4 1][1 3]}{[2 4][4 1][1 3]} \right] 
   = i A_4^{(0)}(\phi, 1_q^-, 3_g^-, 2_q^+, 4_g^-) + \text{terms antisymmetric in } \{3 \leftrightarrow 4 \}. \]

We note that all of these amplitudes are finite because of the vanishing of the corresponding tree graph results (see section 4.1).

5. One-loop results

In this section we present analytic expressions for the full one-loop corrections to the process \( A_4^{(1)}(\phi, 1_q^-, 2_q^+, 3_g^-, 4_g^-) \). All expressions are presented un-renormalised in the four-dimensional helicity (FDH) scheme (setting \( \delta_R = 0 \)) or \('t Hooft-Veltman scheme (setting \( \delta_R = 1 \)).

We employ the generalised unitarity method \[22, 48–51\] to calculate the cut-constructible parts of the left-moving, right-moving and \( n_f \) one-loop amplitudes. This relies on the expansion of a one-loop amplitude in terms of scalar basis integrals,

\[ A_{4;1}^{\text{cut-cons}}(\phi, 1_q^-, 2_q^+, 3_g^-, 4_g^-) = \sum_i C_{4;i} I_{4;i} + \sum_i C_{3;i} I_{3;i} + \sum_i C_{2;i} I_{2;i}. \]

In this sum each \( j \)-point scalar basis integral (\( I_{j;i} \)) appears with a coefficient \( C_{j;i} \). The sum over \( i \) represents the sum over the partitions of the external momenta over the \( j \) legs of the basis integral. Multiple cuts isolate different integral functions and allow the construction of a linear system of equations from which the coefficients can be extracted. We use the quadruple cut method \[22\] which freezes the loop momenta and determines each box coefficient uniquely. Triangle coefficients are determined using the Laurent expansion method \[51\], whilst the two-point coefficients are determined \( \text{via} \) Stokes’ Theorem applied to functions of two complex-conjugated variables \[52\]. Results were obtained using the QGRAF \[53\], FORM \[54\] and S@M \[55\] packages in order to control the extensive algebra.

5.1 Results for \( A_{4;1}(\phi, 1_q, 2_q, 3_g, 4_g^-) \)

The partial amplitude \( A_{4;1}(\phi, 1_q, 2_q, 3_g, 4_g^-) \) is calculated from three primitive amplitudes according to Eq. (3.4). We shall deal with each of these ingredients in turn.

5.1.1 \( A_4^L(\phi, 1_q^-, 2_q^+, 3_g^-, 4_g^-) \)

The full result for this primitive amplitude is given by,

\[ -iA_4^L(\phi, 1_q^-, 2_q^+, 3_g^-, 4_g^-) = -iA_4^{(0)}(\phi, 1_q^-, 2_q^+, 3_g^-, 4_g^-) \times V_1^L \]
\[
\frac{s_{34}^2}{[14][34][2][1(4)+1][3]} \left[ L_{-1}(s_{14}, s_{34}; s_{134}) + \tilde{L}_{-1}^{2m_n h} (s_{12}, s_{134}; s_{34}, m_\phi^2) \right] \\
- \frac{\langle 1 \rangle (34)[2]^2}{(1)(2+3)[4][23][34]} \left[ L_{-1}(s_{34}, s_{23}; s_{234}) + \tilde{L}_{-1}^{2m_n h} (s_{12}, s_{234}; s_{34}, m_\phi^2) \right] \\
+ \frac{m_\phi^4 \langle 14 \rangle^2 (24)}{\langle 1 \rangle \langle 2 \rangle \langle 3 \rangle \langle 4 \rangle \langle 1(4)+3 \rangle[3][1(2)+3][3]s_{124}} \\
- \frac{\langle 3 \rangle (1(4)+2)^3}{[12][24][3][1(1+2)+4][s_{124}]} \left[ L_{-1}(s_{12}, s_{14}; s_{124}) \right] \\
+ \frac{m_\phi^4 \langle 14 \rangle^2 (24)}{\langle 1 \rangle \langle 2 \rangle \langle 3 \rangle \langle 4 \rangle \langle 1(2)+3 \rangle[3][1(2)+3][3]s_{123}} \\
- \frac{m_\phi^4 \langle 14 \rangle^2 (24)}{\langle 1 \rangle \langle 2 \rangle \langle 3 \rangle \langle 4 \rangle \langle 1(2)+3 \rangle[3][1(2)+3][3]s_{123}} \\
\times \left[ L_{-1}^{2m_n h} (s_{34}, s_{123}; s_{12}, m_\phi^2) + \tilde{L}_{-1}^{2m_n h} (s_{14}, s_{123}; s_{23}, m_\phi^2) \right] \\
+ \frac{m_\phi^4 \langle 14 \rangle^2 (24)}{\langle 1 \rangle \langle 2 \rangle \langle 3 \rangle \langle 4 \rangle \langle 1(4)+3 \rangle[3][1(2)+3][3]s_{123}} \\
- \frac{\langle 3 \rangle (1(4)+2)^3}{[12][14][3][1(1+2)+4][s_{124}]} \left[ L_{-1}(s_{12}, s_{14}; s_{124}) \right] \\

- \frac{2(13)^3 \langle 3 \rangle \langle 4 \rangle \langle 1(4)+3 \rangle[3][1(2)+3][3]}{6 \langle 3 \rangle[1]} \tilde{L}_2(s_{123}, s_{12}) \\
+ \frac{\langle 1 \rangle \langle 13 \rangle \langle 16 \rangle \langle 4 \rangle \langle 1(3)+2 \rangle^2[13]^2}{6 \langle 3 \rangle[1]} \otimes \tilde{L}_2(s_{123}, s_{12}) \\
\times \tilde{L}_1(s_{123}, s_{12}) \\
- \frac{2 s_{124}(34)^2(14)[42]}{3} \tilde{L}_3(s_{124}, s_{12}) \\
- \frac{(34) \langle 1 \rangle \langle 2 \rangle \langle 3 \rangle \langle 4 \rangle \langle 1(4)+2 \rangle[14]}{6 \langle 41 \rangle} \tilde{L}_2(s_{123}, s_{12}) \\
- \frac{\langle 3 \rangle \langle 1 \rangle \langle 2 \rangle \langle 9 \rangle \langle 8 \rangle \langle 3 \rangle \langle 4 \rangle \langle 2 \rangle \langle 1 \rangle \langle 1 \rangle \langle 2 \rangle \langle 1 \rangle \langle 1 \rangle \langle 2 \rangle}{6 \langle 124 \rangle \langle 41 \rangle \langle 21 \rangle} \tilde{L}_1(s_{123}, s_{12}) \\
+ \frac{\langle 1 \rangle \langle 13 \rangle \langle 4 \rangle \langle 2 \rangle \langle 3 \rangle \langle 1 \rangle \langle 1 \rangle \langle 2 \rangle}{2 \langle 3 \rangle[1]} \tilde{L}_2(s_{123}, s_{23}) \\
- \frac{\langle 1 \rangle \langle 2 \rangle \langle 3 \rangle \langle 1 \rangle \langle 3 \rangle \langle 4 \rangle \langle 1(3)+2 \rangle[13]^2}{2 \langle 13 \rangle} \tilde{L}_1(s_{123}, s_{23}) \\
\times \frac{s_{234} \langle 1 \rangle \langle 3 \rangle \langle 4 \rangle \langle 2 \rangle}{2 \langle 43 \rangle} \tilde{L}_2(s_{234}, s_{23}) \\
+ \frac{\langle 3 \rangle \langle 4 \rangle \langle 1 \rangle \langle 3 \rangle \langle 2 \rangle \langle 3 \rangle \langle 1 \rangle \langle 1 \rangle \langle 2 \rangle}{2 \langle 1 \rangle \langle 3 \rangle \langle 2 \rangle \langle 3 \rangle \langle 1 \rangle \langle 1 \rangle \langle 2 \rangle} \tilde{L}_1(s_{234}, s_{23}) \\
\times R^L(\phi, 1_q, 2^+, 3^-, 4^-), \quad (5.2)
\]

with,

\[
V_1^L = - \frac{1}{\epsilon^2} \left[ \left( \frac{\mu_2}{-s_{23}} \right)^{\epsilon} + \left( \frac{\mu_2}{-s_{34}} \right)^{\epsilon} + \left( \frac{\mu_2}{-s_{41}} \right)^{\epsilon} \right] + \frac{13}{6\epsilon} \left( \frac{\mu_2}{-s_{12}} \right)^{\epsilon} + \frac{119}{18} - \frac{\delta_2}{6}, \quad (5.3)
\]
and the remaining rational terms given by,

\[
\begin{align*}
R^L(\phi, 1_q^-, 2^+_q, 3_g^-, 4_g^-) &= \frac{(34) \langle 3|1 + 4|2 \rangle (2 \langle 2|4 \rangle [42] - (12) [21])}{12 s_{124} (12) [21] [41]} \\
&+ \frac{(23) \langle 4|(1 + 3)|2 \rangle [(3 \langle 12 |21| - 2 \langle 23 |32|) - 2 \langle 13 \rangle^2 (2 \langle 4|2 + 3|1 \rangle [21] [32] - \langle 4|(1 + 3)|2 \rangle}{12 s_{123} (12) [23] [31] [32]}
\end{align*}
\]

The coefficients of the three mass triangles were calculated using the method of ref. [26],

\[
C_{3;\phi|12\phi 34} (\phi, 1_q^-, 2^+_q, 3_g^-, 4_g^-) = \sum_{\gamma=\gamma_{\pm}} \frac{m^4_\phi (34)^2 \langle 1 K_1^\gamma \rangle^2}{\gamma (\gamma - m^2_\phi) \langle 12 \rangle \langle 3 K_1^\gamma \rangle \langle 4 K_1^\gamma \rangle},
\]

with \( K_1 = -p_1 - p_2 - p_3 - p_4 \), \( K_2 = -p_1 - p_2 \) and the massless vector \( K_1^\gamma \) given by,

\[
K_1^\gamma = \gamma \frac{K_1 - K_2^\gamma K_2^\gamma}{\gamma^2 - K_2^2 K_2^\gamma},
\]

and where \( \gamma \) is given by the two solutions,

\[
\gamma_{\pm} = K_1 \cdot K_2 \pm \sqrt{(K_1 \cdot K_2)^2 - K_1^2 K_2^2}.
\]

The other triangle coefficient is,

\[
C_{3;\phi|41\phi 23} (\phi, 1_q^-, 2^+_q, 3_g^-, 4_g^-) = - \sum_{\gamma=\gamma_{\pm}} \frac{m^4_\phi (14)^2 \langle 3 K_1^\gamma \rangle^2}{2 \gamma (\gamma - m^2_\phi) \langle 1 K_1^\gamma \rangle \langle 2 K_1^\gamma \rangle},
\]

with \( K_1 = -p_1 - p_2 - p_3 - p_4, K_2 = -p_1 - p_4 \) and \( K_1^\gamma \) given in terms of these vectors by Eq. (5.8).

The definitions of the box integral functions \( L_{s-1} \) and \( L_{s-1}^{2m} \) can be found in Appendix B, together with expressions for \( \hat{L}_1, \hat{L}_2 \) and \( \hat{L}_3 \). In addition to logarithms and polynomial denominators, the latter functions also contain rational terms that protect them from unphysical singularities. Thus, for example,

\[
\hat{L}_2(s, t) = \frac{\log (s/t)}{(s - t)^2} - \frac{1}{2(s - t)} \left( \frac{1}{s} + \frac{1}{t} \right),
\]

which is finite in the limit that \( s \rightarrow t \).
5.1.2 $A_4^R(\phi, 1_q^-, 2_q^+, 3_g^-, 4_g^-)$

The result for the right-moving amplitude, $A_4^R(\phi, 1_q^-, 2_q^+, 3_g^-, 4_g^-)$ is,

$$-iA_4^R(\phi, 1_q^-, 2_q^+, 3_g^-, 4_g^-) = -iA_4^{(0)}(\phi, 1_q^-, 2_q^+, 3_g^-, 4_g^-) \times V^R$$

$$+ \frac{[1 2]^2 \langle 4 |(1 + 2)|3 \rangle^2}{[1 3]^3[2 3]s_{123}} L_{s-1}(s_{12}, s_{23}; s_{123}) + \frac{\langle 3 |(1 + 4)|2 \rangle^2}{[1 4] [2 4] s_{124}} L_{s-1}(s_{14}, s_{12}; s_{124})$$

$$- \frac{(1|3 + 4) \rangle^2}{[2 3][3 4][1|2 + 3\rangle^2] L_{s-1}^2(s_{14}, s_{23}; s_{23}, m^2_\phi)$$

$$+ \frac{s_{123}^2}{[1 4][3 4][2|1 + 4\rangle^2] L_{s-1}^2(s_{23}, s_{23}; s_{23}, m^2_\phi)$$

$$- C_{3; 4|1|2|3}(\phi, 1_q^-, 2_q^+, 3_g^-, 4_g^-) \hat{L}_3^m(s_{23}, s_{14}, m^2_\phi) - \frac{1}{2} \frac{\langle 1 4 \rangle^2[1 2]^2 \langle 3 |(1 + 2)|4 \rangle^2}{[1 4] [2 4] s_{124}} \hat{L}_2(s_{124}, s_{12})$$

$$+ \frac{1}{2} \frac{\langle 1|3 + 4\rangle^2}{[2 3][3 4][1|2 + 3\rangle^2} \hat{L}_2(s_{234}, s_{23}) - 2 \frac{\langle 3 4 \rangle (1|3 + 4\rangle^2}{[3 4]} \hat{L}_1(s_{234}, s_{23})$$

$$+ \frac{1}{2} \frac{\langle 1|3 + 4\rangle^2}{[2 3][3 4][1|2 + 3\rangle^2} \hat{L}_0(s_{234}, s_{23}) - \frac{1}{2} \frac{\langle 1 2 \rangle [1 2] [4|2 + 3\rangle^1]}{[1 3]^3 s_{123}} \hat{L}_2(s_{123}, s_{23})$$

$$+ \frac{1}{2} \frac{\langle 1 2 \rangle [4|2 + 3\rangle^1]}{[2 3]|1 3|\rangle^2} \hat{L}_0(s_{123}, s_{23})$$

$$+ \left[ - \frac{1}{2} \frac{\langle 1 3 \rangle [1 2] [4|2 + 3\rangle^1]}{s_{123}^2[1 3]^2 [2 3]|2 3\rangle^2} + \frac{\langle 4|2 + 3\rangle^1}{[1 3]^3 s_{123}} \hat{L}_0(s_{123}, s_{23})$$

$$+ \frac{\langle 1 2 \rangle [4|2 + 3\rangle^1]}{[2 3]|1 3|\rangle^2} \hat{L}_0(s_{123}, s_{23})$$

$$\right]$$

$$+ R^R(\phi, 1_q^-, 2_q^+, 3_g^-, 4_g^-), \quad (5.10)$$

with

$$V^R = -\frac{1}{\epsilon^2} \left( \frac{\mu^2}{s_{12}} \right)^\epsilon - \frac{3}{2\epsilon} \left( \frac{\mu^2}{s_{12}} \right)^\epsilon - \frac{7}{2} - \frac{\delta R}{2}. \quad (5.11)$$

The remaining rational pieces in Eq. (5.10) have the following form:

$$R^R(\phi, 1_q^-, 2_q^+, 3_g^-, 4_g^-) = -\frac{[2 4]^2 [2 1]^2}{2 [2 3][3 1]^2} + \frac{\langle 4|1 + 2\rangle^3 [2 1]^2}{2 s_{123} [3 1]^3 [3 2]} - \frac{\langle 1 4 \rangle^2 [2 1]}{2 [1 2][3 1][3 2]}$$

$$\left[ 2 1 \left( \frac{\langle 1 3 \rangle^2 [2 3][4|1 + 2\rangle^3 [3 1]^2 + \langle 1 2 \rangle^2 [4|2 + 3\rangle^1 [2 1][3 2]}{4 s_{123}^2 [1 2] [2 3][3 1]^3 [3 2]} \right) \right]$$
We can calculate the result for \( R \) (previously known MHV amplitudes \([46]\)). For the NMHV helicity assignment at hand, namely

\[
\begin{align*}
\langle 1 \bar{q} \rangle & \langle 2 \rangle \langle 3 \rangle \langle 4 \rangle [4] [1] [2] [4] [3] [2] [4], \\
\langle 1 \rangle \langle 2 \rangle \langle 3 \rangle [4] [2] [4] [3] [2] [4] \langle 2 \rangle [2] [4] [3] [2] [4] [3].
\end{align*}
\]

For these amplitudes, which are purely rational, the

the previous section the only missing ingredient is

\[
\text{box functions and unchanged.}
\]

The fermion loop contribution is,

\[
-i A_4^f(\phi, 1_\bar{q}, 2_\bar{q}, 3_\bar{g}, 4_\bar{g}) = -i A_4^{(0)}(\phi, 1_\bar{q}, 2_\bar{q}, 3_\bar{g}, 4_\bar{g}) \times \left[ \frac{2}{3} \left( \frac{\mu^2}{-s_{12}} \right)^6 - \frac{10}{9} \right]
\]

\[
+ \frac{2}{3} \langle 1 \rangle \langle 3 \rangle \langle 4 \rangle [4] [2] [1] [2] [1] \hat{L}_3(s_{12}, s_{12}) + \frac{2}{3} \langle 1 \rangle \langle 4 \rangle \langle 3 \rangle [4] [2] [1] [2] \hat{L}_3(s_{12}, s_{12})
\]

\[
- \frac{2}{3} \langle 1 \rangle \langle 3 \rangle \langle 4 \rangle [4] [2] [1] [2] \hat{L}_1(s_{12}, s_{12}) + \frac{2}{3} \langle 1 \rangle \langle 4 \rangle \langle 3 \rangle [4] [2] [1] [2] \hat{L}_1(s_{12}, s_{12})
\]

\[
+ \frac{2}{3} \langle 1 \rangle \langle 3 \rangle \langle 4 \rangle [4] [2] [1] [2] \hat{L}_0(s_{12}, s_{12}) + \frac{2}{3} \langle 1 \rangle \langle 4 \rangle \langle 3 \rangle [4] [2] [1] [2] \hat{L}_0(s_{12}, s_{12})
\]

\[
+ \frac{2}{3} \langle 1 \rangle \langle 3 \rangle \langle 4 \rangle [4] [2] [1] [2] \hat{L}_0(s_{12}, s_{12}) + \frac{2}{3} \langle 1 \rangle \langle 4 \rangle \langle 3 \rangle [4] [2] [1] [2] \hat{L}_0(s_{12}, s_{12})
\]

\[
+ \frac{2}{3} \langle 1 \rangle \langle 3 \rangle \langle 4 \rangle [4] [2] [1] [2] \hat{L}_0(s_{12}, s_{12}) + \frac{2}{3} \langle 1 \rangle \langle 4 \rangle \langle 3 \rangle [4] [2] [1] [2] \hat{L}_0(s_{12}, s_{12})
\]

5.1.3 \( A_4^f(\phi, 1_\bar{q}, 2_\bar{q}, 3_\bar{g}, 4_\bar{g}) \)

The fermion loop contribution is,

\[
\begin{align*}
+ \frac{3}{2} \langle 1 \rangle \langle 3 \rangle \langle 4 \rangle [4] [1] [2] [3] [1] [2] [3] [2] [4] \langle 2 \rangle [2] [4] [3] [2] [4] [3], \\
- \frac{1}{2} \langle 1 \rangle \langle 3 \rangle \langle 4 \rangle [4] [1] [2] [3] [1] [2] [3] [2] [4] \langle 2 \rangle [2] [4] [3] [2] [4] [3],
\end{align*}
\]

5.1.4 Relation for rational terms

We note that the rational terms in the three leading colour primitive amplitudes obey,

\[
\mathcal{R} \left\{ A_4^L(\phi, 1_\bar{q}, 2_\bar{q}, 3_\bar{g}, 4_\bar{g}) + A_4^R(\phi, 1_\bar{q}, 2_\bar{q}, 3_\bar{g}, 4_\bar{g}) + A_4^f(\phi, 1_\bar{q}, 2_\bar{q}, 3_\bar{g}, 4_\bar{g}) \right\}
\]

\[
+ 2 A_4^{(0)}(\phi, 1_\bar{q}, 2_\bar{q}, 3_\bar{g}, 4_\bar{g}) = 0 ,
\]

a formula analogous to that found in super-symmetric decompositions of QCD amplitudes \([21]\). This property is helicity independent and has also been checked for the previously known MHV amplitudes \([46]\). For the NMHV helicity assignment at hand, namely \((1_\bar{q}, 2_\bar{q}, 3_\bar{g}, 4_\bar{g})\), we note that the tree graph result that appears in Eq. (5.14) is zero (c.f. Eq. (1.6)). We stress that the \( \mathcal{R} \) operation extracts the full rational term, including completion terms from the functions \( \hat{L}_3 \) and \( \hat{L}_2 \). Thus it corresponds to dropping all logarithms, box functions and \( V \)-functions.

We conclude this section by noting that the three primitive amplitudes for the helicity assignment \((1_\bar{q}, 2_\bar{q}, 3_\bar{g}, 4_\bar{g})\) displayed in Eqs. (1.7), (1.8), and (1.9), also satisfy Eq. (5.14). For these amplitudes, which are purely rational, the \( \mathcal{R} \) operation leaves the amplitude unchanged.

5.2 Results for \( A_{4,3}(\phi, 1_\bar{q}, 2, 3_\bar{g}) \)

We can calculate the result for \( A_{4,3} \) using Eq. (3.7). Given the results for \( A_4^L \) and \( A_4^R \) in the previous section the only missing ingredient is \( A_4^f(\phi, 1_\bar{q}, 2_\bar{q}, 3_\bar{g}, 4_\bar{g}) \).
5.2.1 Box-related terms for $A^L_4(\phi, 1^-_q, 2^+_g, 3^+_q, 4^-_g)$

The calculation of the box-related terms in $\phi qgqg$ (---++) is easily performed using the methods given in ref. [22]. The result is,

$$-iA^{L,\text{box}}_4(\phi, 1^-_q, 2^+_g, 3^+_q, 4^-_g) = -iA^{(0)}_4(\phi, 1^-_q, 2^+_g, 3^+_q, 4^-_g) \times V^L_4$$

$$+ \frac{(12)^2m^4_\phi}{[1][2][3][4]} L_{s_123}(s_{123}, s_{23}; s_{123}) - \frac{2[1][4][3][4]}{[1][4][3][4]} s_{134} L_{s_123}(s_{134}, s_{34}; s_{134})$$

$$+ \frac{[3][4]^2(12)[3][4][2]^2}{[3][4][1][4][3][4]} L_{s_123}(s_{34}, s_{23}; s_{23}) + \frac{[3][4]^2}{[1][4][3][4]} L_{s_123}(s_{123}, s_{124})$$

$$= \frac{\langle 3[(2 + 4)1][s^2_{124}] \rangle}{[1][4][3][4]} \hat{L}_{s_123}(s_{124}; s_{14}, m^2_\phi) - \frac{\langle 3[(2 + 4)1][3][4][2]^3 \rangle}{[1][4][3][4]} \hat{L}_{s_123}(s_{234}; s_{34}, m^2_\phi)$$

$$+ \frac{1}{s_{123}} \left[ \frac{m^4_\phi(12)[2]^2}{[3][4][1][4][3][4]} + \frac{\langle 4[(1 + 2)3]^2 \rangle}{[1][4][3][4]} \right] \times \hat{L}_{s_123}(s_{123}; s_{12}, m^2_\phi) + \hat{L}_{s_123}(s_{123}; s_{12}, m^2_\phi),$$

with

$$V^L_4 = \frac{1}{\epsilon^2} \left( \frac{\mu^2}{s_{234}} \right)^\epsilon + \frac{1}{3\epsilon} \left( \frac{\mu^2}{s_{41}} \right)^\epsilon + \frac{7}{4} - \frac{\delta_R}{3}.$$  

As we shall see in the next section, no further information is required for the calculation of the $A_{4;3}$ which is completely determined by box diagrams alone.

5.2.2 Full result for $A_{4;3}$

The full result for the partial amplitude $A_{4;3}$ is,

$$-iA^{L,\text{full}}_{4;3}(\phi, 1^-_q, 2^+_g, 3^+_q, 4^-_g) = -iA^{(0)}_{4;3}(\phi, 1^-_q, 2^+_g, 3^+_q, 4^-_g) \times V_4(s_{123}, s_{234}, s_{134}, s_{241})$$

$$+ \frac{1}{s_{123}} \left[ \frac{\langle 4[(1 + 2)3]^2 \rangle}{[1][4][3][4]} \frac{(12)[2]}{[3][1]} + \frac{\langle 3[(2 + 3)3]^2 \rangle}{[1][4][3][4]} \frac{(12)}{[2]} \frac{(1)}{[3][1]} \right] \hat{L}_{s_123}(s_{123}, s_{124})$$

$$+ \frac{1}{s_{124}} \left[ \frac{m^4_\phi(14)[2]^2}{[1][4][3][4]} \frac{(12)}{[2]} - \frac{\langle 3[(1 + 4)2]^2 \rangle}{[1][4][3][4]} \frac{(12)}{[2]} \frac{(1)}{[3][1]} \right] \hat{L}_{s_123}(s_{123}, s_{124})$$

$$+ \frac{1}{s_{123}} \left[ \frac{m^4_\phi(13)[2]^2}{[1][4][3][4]} \frac{(12)}{[2]} \frac{(1)}{[3][1]} - \frac{\langle 3[(1 + 3)2]^2 \rangle}{[1][4][3][4]} \frac{(12)}{[2]} \frac{(1)}{[3][1]} \right] \hat{L}_{s_123}(s_{123}, s_{124})$$

$$+ \frac{s^2_{341}}{[1][3][4]} \frac{(2(1 + 3))[4]}{[2]} \hat{L}_{s_123}(s_{134}; s_{341}) + \frac{s^2_{341}}{[1][4][3][4]} \frac{(2(1 + 4))[4]}{[2]} \hat{L}_{s_123}(s_{134}; s_{341})$$

$$+ \frac{s^2_{341}}{[1][4][3][4]} \frac{(2(1 + 4))[4]}{[2]} \hat{L}_{s_123}(s_{134}; s_{341}) + \frac{s^2_{341}}{[1][4][3][4]} \frac{(2(1 + 4))[4]}{[2]} \hat{L}_{s_123}(s_{134}; s_{341})$$

$$- \frac{\delta_R}{3}.$$
We note that the apparent double pole in $\epsilon$ primitive amplitudes using Eq. (3.5).

Here we present evaluations of the new amplitudes at the same kinematic point as used previously in the literature [17, 46]:

$$
\langle 1\rangle (3 + 4) \langle 2|3 + 4\rangle [L_{s-1}(s_{23}, s_{34}; s_{234})] + L_{s-1}^\epsilon(s_{12}, s_{234}, s_{34}, m_\phi^2)
$$

$$
+ \frac{24^2}{[23][34]} \langle 1(2 + 4)|3\rangle^2 [L_{s-1}(s_{23}, s_{24}; s_{234}) - \langle 1(3 + 4)|2\rangle^2 (1|2 + 4\rangle|3|2 + 3\rangle|4\rangle] \frac{m_\phi^2}{s_{123}} - \frac{4(1 + 3)\langle 2\rangle^2 (4|2 + 3\rangle|1\rangle}{4|1 + 2\rangle[3][12][13]}
$$

$$
+ \frac{1}{s_{123}} \left[ - \left( \frac{m_\phi^2 (13)^2}{s_{123}} \right) - \left( \frac{4(1 + 3)\langle 2\rangle^2}{4|1 + 2\rangle[3][12][23]} \right) \frac{m_\phi^2 (13)^2}{s_{123}} \right] \frac{V_5(s_{12}, s_{34}, s_{13}, s_{24})}{s_{24}} = \frac{1}{\epsilon^2} \left[ \left( \frac{\mu^2}{s_{12}} \right)^\epsilon - \left( \frac{\mu^2}{s_{34}} \right)^\epsilon - \left( \frac{\mu^2}{s_{13}} \right)^\epsilon - \left( \frac{\mu^2}{s_{24}} \right)^\epsilon \right].
$$

(5.18)

We note that the apparent double pole in $\epsilon$ in Eq. (5.18) is cancelled upon expanding about $\epsilon = 0$.

This result for the $\phi$ amplitude is particularly simple, containing neither bubble contributions nor rational terms. This is also true for the helicity amplitude $A_{4;3}(\phi, l_q, 2_q, 3_g, 4_g)$, which can easily be checked using the previously calculated results in ref. [46]. It is therefore more efficient to program the full result for $A_{4;3}$, rather than to program the individual primitive amplitudes using Eq. (3.3).

Furthermore, for the case of two negative gluon helicities calculated here one can check using Eq. (3.3) and Eqs. (4.11), (4.12), (4.14) that the corresponding $\phi^l$ amplitude is zero. Therefore we have,

$$
A_{4;3}(H, 1_q, 2_q, 3_g, 4_g) = iA_{4;3}(A, 1_q, 2_q, 3_g, 4_g) = A_{4;3}(\phi, 1_q, 2_q, 3_g, 4_g).
$$

(5.19)

6. Numerical results

Here we present evaluations of the new amplitudes at the same kinematic point as used previously in the literature [17, 46]:

$$
k_\phi = (-1.00000000000, 0.00000000000, 0.00000000000, 0.00000000000),
$$

\footnote{The amplitude $A_{4;3}(\phi, l_q, 2_q, 3_g, 4_g)$ is not independent and is obtained by swapping labels 3 and 4.}
\[
\phi, 1_{\bar{q}}^-, 2_{\bar{q}}^+, 3_{\bar{q}}^-, 4_{\bar{q}}^-
\]

\[
(\phi^\dagger, 1_{\bar{q}}^-, 2_{\bar{q}}^+, 3_{\bar{q}}^-, 4_{\bar{q}}^-)
\]

\[
\frac{1}{\epsilon^2}
\]

\[
\frac{1}{\epsilon}
\]

\[
\epsilon^0
\]

\[
\epsilon^0
\]

Table 3: Numerical values of \(\phi \bar{q} q g g\) and \(\phi^\dagger \bar{q} q g g\) primitive amplitudes (above) and the amplitudes multiplying the two different colour structures (below), at the kinematic point defined in Eq. (6.1).

We have used a scale \(\mu = m_H\), set \(\delta_R = 1\) (corresponding to the ‘t Hooft-Veltman scheme) and, in assembling the amplitude \(A_{4;1}\), have used \(n_f = 5\). The results for the final Higgs amplitudes presented in Table 3 agree with those from the semi-numerical calculation of ref. [17] to one part in \(10^8\). Note that these results depend on an overall phase that can be removed by dividing out by the corresponding Born calculation. Using the analytic expressions for all the \(H \bar{q} q g g\), \(H \bar{q} g q g\) and \(H \bar{q} q^* q^*\) amplitudes that are now available we can also confirm\(^2\) the numerical values for the matrix elements squared given in ref. [17].

7. Conclusions

In this paper we have computed the last remaining, analytically unknown, helicity amplitude contributing to the NLO corrections to Higgs plus two jet production at hadron colliders. This builds upon the previously known semi-numerical results [17] and completes the set of compact analytic formulae [41–46].

We employed a generalised unitarity approach to calculate the cut-constructible parts of the amplitude. Completion of the logarithmic terms to remove unphysical singularities

\(^2\)Fortran code that calculates all the amplitudes can be downloaded from mcfm.fnal.gov.
was used to simplify rational terms extracted from a Feynman diagram calculation. Simplications in the construction of the subleading colour amplitude, $A_{4;3}$, showed that this component is free from all rational, bubble and triangle terms. Similar relations between the rational terms in the left, right and fermion loop primitive amplitudes were used to find a compact analytic structure.

Our results have been verified against the known numerical results and we envisage that they will provide the means for a faster and more flexible analysis of Higgs phenomenology at the Tevatron and the LHC.

Acknowledgments

We are happy to acknowledge useful discussions with Nigel Glover, Pierpaolo Mastrolia and Giulia Zanderighi. CW acknowledges the award of an STFC studentship and SB acknowledges support from the Helmholtz Gemeinschaft under contract VH-NG-105. Fermilab is operated by Fermi Research Alliance, LLC under Contract No. DE-AC02-07CH11359 with the United States Department of Energy.

A. Spinor notation

Our spinor notation is quite standard in the QCD literature, (for a review see refs. [56, 57]) The function $u_{\pm}(k_i)$ is a massless Weyl spinor of momentum $k_i$ and positive or negative chirality. In terms of these solutions of the Dirac equation, the spinor products are defined by,

\[
\langle ij \rangle = \langle i^-|j^+ \rangle = \bar{u}_-(k_i)u_+(k_j), \quad [ij] = \langle i^+|j^- \rangle = \bar{u}_+(k_i)u_-(k_j).
\]  

We use the convention $[ij] = \text{sgn}(k_0^ik_0^j)\langle ij \rangle^*$, so that,

\[
\langle ij \rangle \langle ji \rangle = 2k_i \cdot k_j \equiv s_{ij}.
\]  

We further define,

\[
s_{ijkl} \equiv (k_i + k_j + k_l)^2 = \langle ij \rangle \langle jk \rangle + \langle il \rangle \langle lk \rangle + \langle i l \rangle \langle l i \rangle,
\]  

\[
\langle ab \rangle \langle cd \rangle = \langle ac \rangle \langle bd \rangle + \langle ad \rangle \langle bc \rangle - \langle ac \rangle \langle bd \rangle - \langle ad \rangle \langle bc \rangle
\]  

Simplification of the formula can sometimes be achieved by using the Schouten identity,
B. Definitions of special functions

With the definition of the $L_i(s, t)$ basis functions,

$$L_i(s, t) = \frac{\log(s/t)}{(s-t)^i}, \quad (B.1)$$

we can define the completions,

$$L_3(s, t) \to \tilde{L}_3(s, t) = L_3(s, t) - \frac{1}{2(s-t)^2} \left(\frac{1}{s} + \frac{1}{t}\right),$$

$$L_2(s, t) \to \tilde{L}_2(s, t) = L_2(s, t) - \frac{1}{2(s-t)} \left(\frac{1}{s} + \frac{1}{t}\right),$$

$$L_1(s, t) \to \tilde{L}_1(s, t) = L_1(s, t), \quad (B.2)$$

such that the completed functions are finite in the limit that $s \to t$. Note that the definition of these completed logarithmic functions is similar in spirit, but different in detail from the definitions in ref. [46].

We also need the box functions from the scalar box with one massive external leg,

$$L_{s-1}(s, t; m^2) = \text{Li}_2 \left(1 - \frac{s}{m^2}\right) + \text{Li}_2 \left(1 - \frac{t}{m^2}\right) + \log \left(\frac{s}{m^2}\right) \log \left(\frac{t}{m^2}\right) - \frac{\pi^2}{6}, \quad (B.3)$$

and coming from the box with two adjacent massive external legs,

$$\tilde{L}_{s-1}(s, t; m_1^2, m_2^2) = -\text{Li}_2 \left(1 - \frac{m_1^2}{t}\right) - \text{Li}_2 \left(1 - \frac{m_2^2}{t}\right) - \frac{1}{2} \log^2 \left(-\frac{s}{t}\right)$$

$$+ \frac{1}{2} \log \left(-\frac{s}{-m_1^2}\right) \log \left(-\frac{s}{-m_2^2}\right), \quad (B.4)$$

where the dilogarithm is defined as usual by,

$$\text{Li}_2(x) = -\int_0^x dy \, \frac{\log(1-y)}{y}. \quad (B.5)$$

$I^3_m$ is the three mass triangle function defined, for example, in Eq. (II.9) of ref. [58],

$$I^3_m(s_{12}, s_{34}, s_{56}) = \int_0^1 d^3a_1 \, \delta(1-a_1-a_2-a_3) \, \frac{1}{[-s_{12}a_1a_2-s_{34}a_2a_3-s_{56}a_3a_1]}. \quad (B.6)$$

Explicit results for this integral can be found in refs. [59], [60] and [61].
