

Table of Contents

1. Experimentals
 - Plastic deformation in pure polycrystalline metals
 - Niobium: origin, purity, structural state
 - Experimental set-up and conditions
2. Low temperature mechanical properties of Niobium (-253 degrees C, +25 degrees C)
 - Traction curves
 - Deformation modes
 - Evolution of mechanical properties with temperature
3. Mechanisms involved in low temperature plastic behavior of Niobium
 - Theoretical models
 - Plastic flow parameters
 - Thermal activation parameters
 - Relation between models and experimental results
 - Conclusion
4. Rupture models in Niobium
 - Temperature and purity influence
 - Strain rate influence
 - Grain size influence
 - Study of rupture faces - comparison between unequal techniques
 - Conclusion
5. Ductile - Fragile transition and fracture mechanisms in Niobium
 - Rupture mechanisms
 - Ductile - Fragile transition
 - Early rupture: interpretation
 - Conclusion
6. Intermediate temperature (25 degrees C - 850 degrees C): mechanical behavior of Niobium
 - Traction curves
 - Deformation nodes
 - Evolution of mechanical properties with temperature
7. Mechanism involved in intermediate temperature plastic behavior of Niobium
 - Portevin - LeChatelier effect in Niobium
 - Interpretation of plastic behavior

General conclusion
