Thank you to Sasha Valishev and Mary Convery for help with slides.

Outline

• Fermilab Accelerator Complex now and in the PIP-II/LBNF era
• Accelerator Complex Evolution (ACE) plan
• Beam to experiments under ACE plan
Recent Performance at Fermilab NuMI Beamline

Record beam power of 895 kW!
Typical operating power 680 kW.
69% uptime during 9-month run.

Record beam power of 959 kW!
Typical operating power 780 kW.
88-day downtime due to NuMI horn failure.

Protons to neutrino program will be maximized by beam power and uptime!
NuMI Horn/Stripline Failure

(left) Crack in the NuMI Horn stripline above the Horn 2 penetration.
• Believed to be the friction stir welding, not prepped correctly after welding.
(middle, right) Failure in the stripline part of the Horn 2 face, source of failure still being understood.
Accelerator Complex

SwitchYard120: test beam (FTBF), SpinQuest

Irradiation Test Area (ITA) in Linac

Short Baseline Neutrino:
ICARUS, ANNIE, SBND

Long Baseline Neutrino:
NOvA

Muon Campus:
g-2 (completes this year), Mu2e (commissioning)
Introduction to Fermilab accelerators

- 400 MeV linac ~20mA

Booster synchrotron (1970)
- H⁻ stripping injection (1978)
  16 turns to ~4.7x10¹² p per pulse
- Ramp from 0.4 to 8 GeV at 15 Hz

Recycler (1998)
- 3.3 km permanent magnet 8 GeV ring
- Slip-stacking 12 Booster batches, ~56x10¹² p
- Also re-bunches beam for Muon Campus

Main Injector (1998)
8 to 120 GeV ramp, cycle time 1.2-1.4 s
Accelerator Complex in PIP-II / LBNF era (pre ACE plan)
Jeffrey Eldred | Status and Recent Developments at the Fermilab Accelerator Complex
Accelerator Complex in PIP-II / LBNF era (pre ACE plan)

PIP-II Project provides
- New SRF linac for injection into Booster at 800 MeV (present 400 MeV).
- Booster cycle rate upgraded to 20 Hz from 15 Hz.
- Increased proton beam intensity for 1.2 MW beam power from MI.

Accelerator Complex in PIP-II / LBNF era (pre ACE plan)

LBNF/DUNE-US Project provides
- New proton beamline for up to **2.4 MW**
- Target systems for **1.2 MW**
- Shielding and absorber for up to **2.4 MW**
PIP-II upgrade will provide proton power of 1.2 MW (at most 1.35 MW).
Past & Future Long Baseline Neutrino Program (with ACE)

PIP-II upgrade will provide proton power of 1.2 MW (at most 1.35 MW). ACE upgrade to 2.4 MW will make best use of the 40 kT DUNE detector.
Accelerator Complex Evolution (ACE) plan

1.2 MW
- PIP-II Project replaces Linac
- Modernization/upgrades of complex

2 MW
- Reliability upgrades
- Main Injector capabilities (cycle time)
- Target Systems capability improvements

2.4 MW
- Booster replacement
  - PIP-II Linac extension to 2GeV
  - New physics capabilities

Previously referred to as PIP-III

ACE-MIRT

ACE MIRT – Main Injector Ramp & Targety

Advantages over increasing the per-pulse intensity – reduces likelihood of space charge effects and instabilities, and reduces impact of limited aperture

To shorten the MI cycle from 1.2-1.4s to 0.65s, the ramp needs to be ~twice as fast

Requires more voltage and electrical power
- Power supplies, transformers, feeders, service building size, additional tunnel penetrations, additional cooling

RF accelerating system
- Replace cavities with newer design (more volts per cavity) or add cavities of current design

Regulation, control & instrumentation
- New low-level RF, new power supply regulation/control system

Beam dynamics, losses and shielding
- Upgrade MI collimators, upgrade abort line
Improving reliability of the complex

Overall Efficiency

- **Beam Power**, percentage of maximum.
- **Uptime**, percentage of run period.
- **Run Length**, percentage of year.

ACE will

- Replace old infrastructure, design for reliability.
- Procure spares, plan for repairs.
- Improve shutdown work planning.

**ACE-MIRT Workshop last January:**

- Controls, personnel, instrumentation, power supplies

Overall FY22 efficiency 41%,
DUNE/PIP-II goal 57%
DUNE Power and Protons-on-Target (POTs)

- Mu2e complete in 2033
- Booster replacement
- (Mu2e restarts 2029)
LBNF target systems

- Removable Steel Shielding: 2.4 MW
- Work Cell: 2.4 MW
- Decay Region Upstream Window: >1.2 MW?
- Steel Shielding: 2.4 MW
- Horn C: >1.2 MW?
- Cooling Panels: 2.4 MW
- Horn B: >1.2 MW?
- 1.2 MW Horn A with Target 1.2 MW
- Baffle: >1.2 MW?
- Primary Beam Window Assembly: 2.4 MW
Target development staged approach

- **Stage 1** – Push current designs (1.2 MW) to validated limitations
- **Stage 2** – Design and build 2nd generation components with modifications to existing designs to raise limits while maintaining reasonable useful \( \nu \) flux/POT
- **Stage 3** – Design and build fully optimized next generation systems to take full advantage of maximum POT from accelerator complex (may not be needed)

Materials R&D results needed to inform design modifications for higher beam power.
Target materials R&D on critical path to 2+ MW target

1. Identify candidate materials
2. High-energy proton irradiation of material specimens to reach expected radiation damage
3. Pulsed-beam experiments of irradiated specimens to duplicate loading conditions of beam interactions
4. Non-beam PIE (Post-Irradiation Examination) of specimens
   - Material properties
   - Microscopic structural changes
   - High-cycle fatigue testing

Five-year cycle needs to start ASAP
Horns for 2.4 MW performance

- Horn A requires reanalysis and likely redesign
  - 1.2 MW analysis indicates 2.7 safety factor on fatigue endurance limit
  - Likely redesign to:
    - Avoid beam heating in critical locations
    - Strengthen structure in critical locations
- Horns B&C see less beam heating
  - Safety factor: 7.3 for 1.2 MW operation
  - Require reanalysis, but less likely redesign
LBNF beamline

Larger power supplies to ramp twice as fast, may need more building space
Kicker power supply modifications to charge up faster
Cooling water: additional pumps to remove and exhaust additional heat
Impact of ACE-MIRT shortened cycle on other experiments

• In a nominal 1.2s cycle at 20Hz
  – 12 Booster batches slip-stacked together in the Recycler, accelerated to 120 GeV in the MI, extracted to LBNF (~0.65s in Recycler)
  – 2 Booster batches for Mu2e rebunched in the Recycler and extracted to the Delivery Ring one bunch at a time, as the bunch is resonantly extracted from the Delivery Ring in a 0.43ms slow spill to Mu2e (~0.55s in Recycler)
  – 10 Booster batches available to other experiments while Mu2e beam is in the Recycler

• In a 0.65s cycle (pre Booster Replacement)
  – Recycler not available for Mu2e (finish Mu2e before reduce cycle time)
  – 1 Booster batch available to other experiments
Accelerator Complex Evolution (ACE) plan

- **1.2 MW**
  - PIP-II Project replaces Linac
  - Modernization/upgrades of complex

- **2 MW**
  - Reliability upgrades
  - Main Injector capabilities (cycle time)
  - Target Systems capability improvements

- **2.4 MW**
  - Booster replacement
    - PIP-II Linac extension to 2GeV
    - New physics capabilities

---

**ACE-MIRT**
Main Injector Ramp & Targetry

**ACE-BR**
Booster Replacement

---

2.4 MW Upgrade with Reliability, Capability, Capacity
Mu2e complete in 2033

(Mu2e restarts 2029)
ACE BR – Booster Replacement

The Fermilab Booster will be over 60 years old.

- Booster intensity limited by the injection region and transition-crossing.

ACE BR is a new accelerator that will be greater reliability and intensity.

- Either a 2-GeV Linac + a 2-8 Rapid-Cycling Synchtron (RCS)
  - Or an 8-GeV SRF Linac + an 8-GeV Accumulator Ring (AR)

ACE-BR will provide 2.4 MW to LBNF.

Potential new science beamlines (‘spigots’):

- 2 GeV Continuous Wave (CW)
- 2 GeV Pulsed Beam (~ 1MW)
- 8 GeV Pulsed (~ 1MW)

Platform for collider R&D; upgradeable to front-end for future Muon Collider.

Example Booster replacement options and possible add-ons

2 GeV Linac + 2–8 GeV RCS  or  8 GeV Linac + 8 GeV AR
Booster replacement options

- Extend SRF Linac to higher energy or construct new Rapid-Cycling Synchrotron
- Looked at 3 representative options of each type
- All six configurations require an extension of the SRF Linac to 2 GeV
  - The RCS option will benefit from the reduced space charge at the increased energy
  - The high-energy linac option will need the beam with an approximate energy of 2 GeV to take advantage of higher frequency, $\beta = 1$, high-gradient cavities that can be grouped and fed from a single, high-power klystron.
- Parameters can be re-optimized based on future experimental program.

Rapid-Cycling Synchrotron (RCS)

- **v1**: 10 Hz: Metallic vacuum chamber
- **v2**: 20 Hz: Ceramic vacuum chamber, larger aperture magnets, accumulator ring
- **v3**: 20 Hz: (C1b) with high-current linac, no accumulator ring

SRF Linac and Accumulator Ring

- **v1**: Basic: small increase in PIP-II current, using demonstrated XFEL RF
- **v2**: High current (5mA) and some RF R&D
- **v3**: High current and significant RF R&D
Challenges and R&D Topics

H⁻ Foil Injection (RCS, Linac)
- Foil overheating, particles scattering off foil, unstripped H, overall chicane length.
- Greatest challenge for RCS and Linac scenarios (although not for PIP-II Booster).
- Laser H⁻ stripping injection could be the way forward.

SRF Technology (Linac)
- Improve accelerating gradient and Q-factors.
- Develop XFEL-style klystrons with 3ms long pulses.

Metallized Ceramic Beampipe (RCS)
- Can metallized ceramic beampipe (like at J-PARC, ISIS) be deployed with a smaller aperture, reduced impedance, and greater replaceability?

Space-Charge (RCS)
- Bunch-lengthening RF and injection painting, but also electron-lenses?
Summary

• The ACE plan includes the following key components

  1. Upgrades to Main Injector accelerator systems and infrastructure to enable beam power above 1.2MW through faster cycle time and efficient operations of the complex with the aim of achieving DUNE goals as fast as possible, upgrades between 2024 and 2032

  2. Accelerated profile of high-power target system R&D to enable above 1.2MW operations in DUNE Phase I

  3. Establishment of a Project for Booster Replacement with superior capacity, capability, and reliability to be tied to the accelerator complex at a time determined by the DUNE physics

• Neutrino beam challenges and R&D areas

  – **Near-term**: high-power targetry, reliability, controls, ML.
  
  – **Next-gen**: H- injection, SRF gradients, machine impedance, space-charge.
Backup Slides
(ACE-Era Experimental Program)
Impact of shortened cycle on other experiments

**PIP-II Era MI Cycle:**
- 1.2 sec
- 24 Ticks, 12 to NOvA, 8 to Mu2e @43 ms spill

**ACE-MIRT MI Cycle:**
- 0.7 sec
- 14 Ticks, 12 to NOvA, 2 available
Options for beam sharing for DUNE / Mu2e

1. Limit beam power to DUNE (1.2s cycle) until Mu2e complete (2033)
   - Mu2e beam request is $3.6 \times 10^{20}$ POT physics data, total $4.7 \times 10^{20}$ including calibration
   - May be consistent with LBNF/DUNE commissioning, high-power target/horn development

2. Run shorter cycle time with shortened spill durations to Mu2e
   - Has some effect on Mu2e physics, working with experiment to quantify

3. Run shorter cycle time with fewer spills to Mu2e
   - Extends duration needed to obtain requested Mu2e dataset
   - DUNE larger initial dataset but no overall gain
   - Less efficient use of Recycler

Fermilab is committed to delivering Mu2e

**0.8-2.0 GeV Power**: Pulsed power only if there is an accumulator ring, and only up to the capabilities of the accumulator ring.

**8 GeV Power**: What is available after serving DUNE/LBNF program. ACE-BR has a major impact on the 8-GeV power!
Fermilab ACE program offers several synergies with Muon Collider R&D.

The ACE Booster Replacement plan could provide a path to a Muon Collider front-end.
Start with ACE-Linac v2 Configuration

That is $10 \text{ Hz} \times 5 \text{mA} \times 2 \text{ms} \times 8 \text{ GeV} = 0.8 \text{ MW}$

Upgrading to linac current $6-25 \text{mA}$, we have $1-4 \text{ MW}$.

Can we re-use the 8-GeV AR from ACE for MuC?

- MuC requirements are stricter than neutrino requirements.
  - Overdesign or re-build the 8-GeV AR?
  - In the meantime any 8-GeV AR is useful for R&D.

MuC would also need an compressor ring, combiner, targetry.

- These upgrades could occur in stages in parallel with MuC R&D, construction, commissioning.
Backup Slides
(Excerpts from HB2021)
Linac Upgrades & Studies

Recent Upgrades
- New Marx Modulators (2018)
- LEBT collimator.
- MEBT diagnostic package: bpm + toroid + halo monitor.

Upcoming
- Linac ML project: RF tuning + downtime prediction.
- Bunch length monitor.
- Moveable BLMs along low-energy DTL section.
Booster Upgrades

Recent Upgrades
- “Wide Bore” RF Cavity installed
  - 2.25” -> 3.25” diameter bore.
  - 50 kV -> 60 kV RF cavity voltage
- IPMs calibrated for SC and ion effects. [paper]
- Transverse stripline system with sub-ns resolution.
- New Ion Pumps.
- New BPM data acquisition system.

Upcoming (2022)
- Flat Injection
- New Digital LLRF system
- Improved Longitudinal Damper (reduced delay)
- New digital mode-2 longitudinal damper
- NPCT (new parametric current transformer)
- Gradient Magnet Power Supply (GMPS) ML regulation. [paper]
Booster Studies

Space-charge Emittance Growth. [paper](#).

2Qy Resonance Correction.

Investigation of possible Booster Electron Cloud.

Longitudinal RF Adiabatic Capture.

Transition-Crossing.

“Double-Notch” used to investigate ecloud
Recycler Ring / Main Injector, Studies & Upgrades

**Main Injector**
- Faster Main Injector cycle – demonstrated 1.333 s -> 1.2 s
- ML study to distinguish losses in Recycler and Main Injector

**Recycler Ring**
- Corrected optics to reduce beta-beating.
- Sextupoles installed to correct 3Qx and 3Qy resonances.
- Demonstrated “off-momentum” slip-stacking to reduce momentum span during slip-stacking operations (for PIP-II).
- Controlled excitation of convective instability in Recycler.
- 2020 DOE Early Career Award: Robert Ainsworth

Fermilab Superconducting RF Cavity Activities

Frontier Projects
- PIP-II
- LCLS-II, LCLS-II-HE (including cryomodule production)
- HL-LHC AUP (crab cavities)

Leading R&D Activities
- High Q₀ development (e.g. doping of superconductor)
- High gradient with high Q₀ R&D (e.g. multi-step bake)
- New materials (e.g. Nb₃Sn)

Spin-offs from Scientific Accelerator R&D
- Industrial accelerator development (e.g. conduction cooling)
- High coherence quantum systems (quantum computing, sensing)
Fermilab SC magnet projects and R&D

Current Frontier Projects
Mu2e transport solenoid
HL-LHC AUP IR quadrupoles

High field magnets for application in HEP will require high performance SC. A new Nb$_3$Sn conductor based on the Artificial Pinning Center technology, has been developed and achieved world-leading results with wires surpassing FCC specifications.

The field levels achieved in dipole model MDPCT1 at 4.5 K and 1.9 K set new world records for Nb$_3$Sn accelerator magnets

\[ B_{\text{max}} = 14.5 \text{ T @1.9 K} \]

High field magnets for application in HEP will require high performance SC. A new Nb$_3$Sn conductor based on the Artificial Pinning Center technology, has been developed and achieved world-leading results with wires surpassing FCC specifications.
Fermilab Fast-ramping Super-ferric Magnets

YBCO-based HTS super-ferric dipole demonstrated >300 T/s. [paper](#).

Appropriate technology for a fast-ramping ultra-compact RCS.
- Less circumference required for extraction energy $\rightarrow$ RF power more efficient.
- More aperture at required field strength $\rightarrow$ greater beam intensity.
FAST/IOTA: Accelerator R&D Facility at Fermilab
FAST/IOTA Developments

Recent (Run 2)
- First Demonstration of Optical Stochastic Cooling
- 2020 DOE Early Career Award: Jonathan Jarvis
- Nonlinear Integrable Optics with e- beam.
- Single-Electron Radiation Studies

Upcoming
- 2.5 MeV Proton Injection into IOTA
- Nonlinear Integrable Optics with p+ beam.
- Electron Lens Studies.

Coming up soon!
2021 FAST/IOTA Collaboration meeting on Oct 27th.
