

BOOSTER NOMENCLATURE

Roy Billinge

April 14, 1969

Following the decision to eliminate the "Black Hole," it seems propitious to redefine the nomenclature for identifying machine periods in the Booster. As before, a machine period is defined as beginning at the upstream end of a long straight section.

The new injection straight section (located at Project West) is now number 1 and the long straight sections are now allocated as follows:

1. Injection
2. Injection Diagnostics
3. Passive Compensators
4. Passive Compensators
5. Passive Compensators
6. Scraper
7. Scraper
12. Extraction Kickers
13. Extraction Septum
14. RF

15. RF
16. RF
17. RF
18. Radial and Phase Electrodes
19. Wide Band Beam Detector
20. Radial and Phase Electrodes
21. RF
22. RF
23. RF
24. RF
